Lab 1 possible research questions

1. Are 3 seconds enough to identify a genre?
2. Does combining short windows beat one long window?
3. How many segments do you need?
4. Does position within the clip matter?
5. Is the 3 s accuracy real or inflated?
6. Are the differences between models significant?
7. Which genres are most similar given these descriptors?
8. Is confusion symmetric?
9. Does the data agree with musicological intuition?
10. Would a hierarchical classifier help?
11. Which feature families matter most?
12. Does feature selection reduce overfitting or just cost?
13. Do different algorithms make the same mistakes?
14. Which songs are misclassified by every model?
15. Is single-label genre classification even well posed?
